1 Introduction

2 1.1 Service Overview

3 The Search Component, as defined by the Intelligence Community/Department of
4 Defense (IC/DoD) Content Discovery and Retrieval (CDR) Specification Framework
5 [CDR-SF], serves as the primary content discovery mechanism to expose content
6 collections for discovery and accessibility. This component provides a common interface
7 and behavioral model for IC and DoD content collections, enabling content consumers to
8 discover relevant content resources from disparate collections across the IC/DoD
9 enterprise.

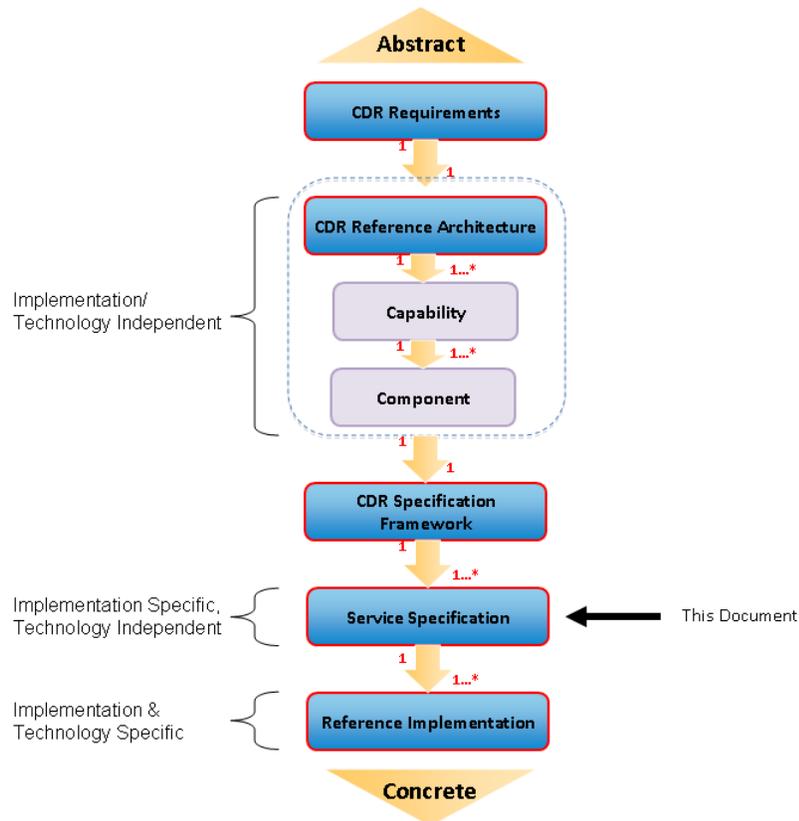

10
11 This specification defines requirements and provides guidelines for the realization of the
12 CDR Search Component as a RESTful, OpenSearch [OS] web service, hereafter termed a
13 Search service in this document. It describes a Search service's behavior, interface and
14 other aspects in detail, providing enough information for Search service providers and
15 implementers to create CDR-compliant Search services.

16
17 The Search service exposes a single Search operation that is responsible for three
18 activities that underpin Content Discovery capabilities: search, result presentation, and
19 results paging. As discussed in the CDR Specification Framework, a Search service's
20 results are resource metadata rather than actual content resources. In the context of
21 Search, resource metadata generally refers to a subset of a resource's available metadata,
22 not the entire underlying record¹. Some of the information contained within each Search
23 result may provide the information necessary for a consumer to retrieve or otherwise use
24 a resource.

25 1.2 Relationship to Other CDR Architecture Elements

26 The CDR Architecture prescribes an abstract-to-concrete model for the development of
27 architecture elements and guidance for content discovery and retrieval. Each layer or tier
28 of the model is intended to provide key aspects of the overall guidance to achieve the
29 goals and objectives for joint DoD/IC content discovery and retrieval. The following
30 graphic, discussed in detail within the CDR Reference Architecture [CDR-RA],
31 illustrates this model.
32

¹ The Search Component returns metadata about a resource, which may sometimes describe the underlying resource (e.g., an image), while at other times representing a sub-set of the data the makes up a resource (e.g., a collection of attributes). In some cases, the metadata returned from an instantiation of the Search function and the Retrieve function, which returns a resource itself, may happen to be the same, though this considered an edge condition.

33
34 **Figure 1 - CDR Architecture Model**

35
36 As illustrated in Figure 1, the Specification Framework derives from the Reference
37 Architecture (RA) and can describe behavior in terms of the capabilities, components,
38 and usage patterns defined in the RA. The Specification Framework allows multiple
39 Service Specifications to provide consistent interfaces, both in terms of the structure and
40 semantics of the exchanged information.

41
42 This specification provides guidance for implementing the CDR Search Component using
43 the RESTful OpenSearch [OS] standard. It is intended to provide minimal requirements
44 for implementing OpenSearch. Additional sub-specifications will provide further
45 guidance for implementation profiles that include specific query types and result formats.
46

47 **1.3 Notational Convention**

48 The key words "MUST," "MUST NOT," "REQUIRED," "SHALL," "SHALL NOT,"
49 "SHOULD," "SHOULD NOT," "RECOMMENDED," "MAY," and "OPTIONAL" in
50 this specification are to be interpreted as described in the IETF RFC 2119. When these
51 words are not capitalized, they are meant in their natural-language sense.
52

53 When describing concrete XML schemas and example XML documents, this
54 specification uses XPath as the notational convention. Each member of an XML schema
55 is described using an XPath notation (e.g., /x:RootElement/x:ChildElement/@Attribute).

56

57 To make the text easier to read and understand, some examples include data types that are
58 derived in auxiliary specifications from abstract types defined in this specification. To
59 distinguish these derived types from those defined as part of this Search Specification,
60 they are presented in green.

61

62 Examples in this text are distinguished by a black border. These are meant to be
63 illustrative and only one way that the described syntax can be used.

64

```
65 <atom:entry>
66 <atom:title>This is an example.</atom:title>
67 </atom:entry>
```

68

69 **1.4 Conformance**

70 Search services must support OpenSearch 1.1 Draft 4 [OS].

71

72 This specification defines an interface to a Search service to which an implementation
73 and a subsequent deployment **MUST** conform. A deployment is an instance of an
74 implementation. For an implementation to conform to this Search specification, it **MUST**
75 adhere to all mandatory aspects of the specification.

76 **1.5 Namespaces**

77 Namespaces referenced in this document and the prefixes used to represent them are
78 listed in the following table.

79

80

Table 1 – Referenced XML Namespaces

Prefix	URI	Description
opensearch	http://a9.com/-/spec/opensearch/1.1/	OpenSearch 1.1 (Draft 4) ²
atom	http://www.w3.org/2005/Atom	Atom 1.0

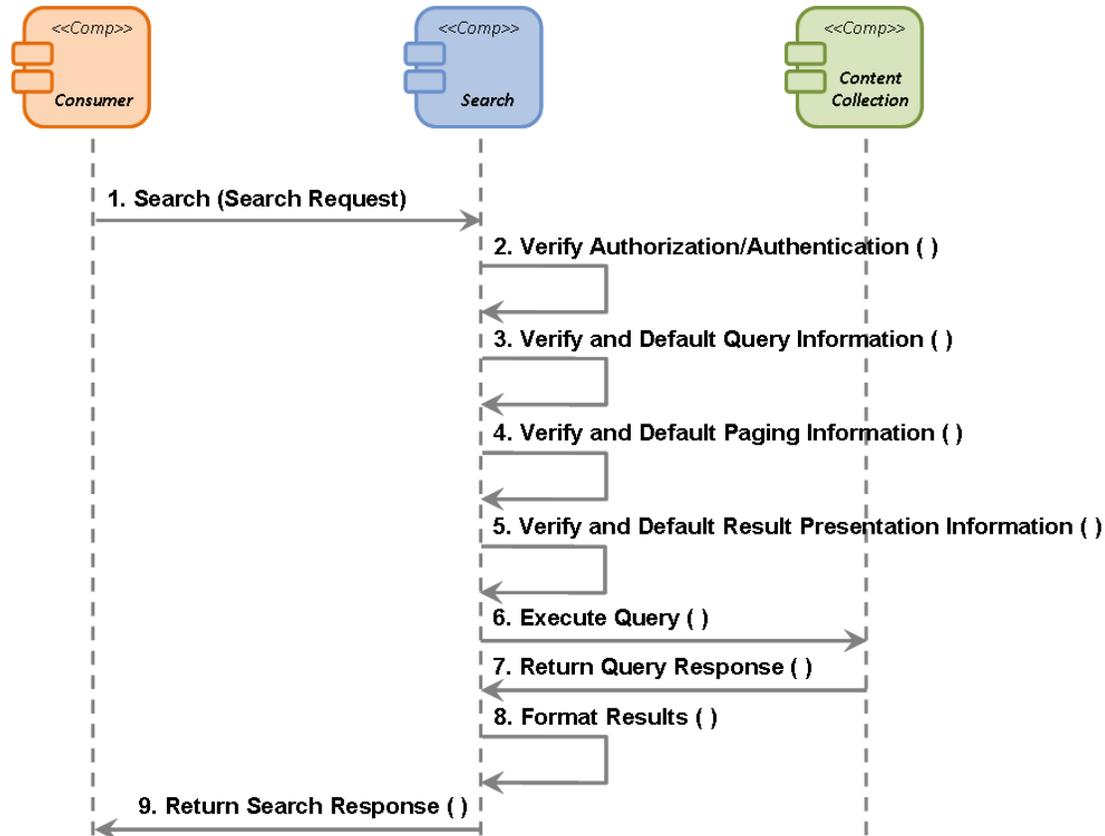

81 **1.6 License**

82 This specification is licensed under the Creative Commons Attribution-ShareAlike 2.5
83 Generic License (<http://creativecommons.org/licenses/by-sa/2.5/>), because it builds on
84 the OpenSearch [OS] standard, which is licensed with the share-alike clause.

² The OpenSearch specification can be found at http://www.opensearch.org/Specifications/OpenSearch/1.1/Draft_4.

85 **2 Search Service Behavior**86 **2.1 Main Flow**

87

88

89

90

91

92

93

94

95

96

97

98

99

100

101

102

103

104

105

106

107

1. The Consumer invokes the Search function on the Search Component with the parameters for a particular type of Search Request specified. The Search Request contains the query, paging information and any other information required by the particular query type being sent.
2. The Search Component leverages a set of security components to verify that the Consumer is authenticated and authorized to perform the search query. The DoD/IC Service-Oriented Architecture Security Reference Architecture [SEC-RA] defines the specific security components and interactions needed to perform this verification. See Section 4.5 of this document.
3. The Search Component checks the type of the incoming Search Request (e.g., keyword, temporal etc.) to verify that it supports that particular type and that its syntax is valid.
4. The Search Component checks the validity of the provided paging information and utilizes default values for any that are missing.
5. Because Search service result presentation is completely determined via the OpenSearch binding, this step of the main flow is not applicable to OpenSearch-based Search services.

- 108 6. The Search Component executes the query against its Content Collection.
109 7. The Search Component receives the results for the query that was executed
110 against its Content Collection.
111 8. The Search Component performs any necessary formatting of the results before
112 returning a response to the Consumer.
113 9. The Search Component returns a formatted response back to the Consumer
114 containing:
115 • A result set containing the resource metadata for each search result, presented
116 in the format associated with the service's interface.
117 • A Timestamp containing the time that the search was executed.
118 • The Start Index value that was used.
119 • The Results Per Page value that was used.
120 • The Input Search Request that was executed.
121 • The Response Result Count containing the number of results within the
122 current page.
123 • The Total Result Count containing the number of total results matching the
124 Input Search Request that was executed, if available.

125 **2.2 Query**

126
127 The OpenSearch specification does not define a syntax for its primary query parameter,
128 searchTerms, but it is generally used to support simple keyword queries. There are a
129 number of OpenSearch extensions that support query types beyond simple keyword
130 queries as well. These include the OpenSearch Geo Extension [OS-GEO] for geospatial
131 query terms, and the OpenSearch Time Extension [OS-TIME] for temporal query terms.
132 Use of these extensions is discussed in more detail in section 3.1.3. Additional query
133 types may be developed by the CDR in the future.

134 **2.3 Paging**

135 Paginated search results can be useful when the number of results is very large, infinite,
136 or indeterminate. Service consumers can page through the result sets, accessing a subset
137 of the overall result set as necessary. This capability will prevent search requests with
138 very large result sets from overloading the server, network, or client.

139 Search result pages may be traversed using the information from the original Search
140 service request combined with the endpoint information provided by the OpenSearch
141 Description (OSD) document describing the Search service from which the current result
142 set was generated. The Search service OSD allows a service consumer to issue a search
143 request for the next "page" of data.

144 CDR implementations SHOULD support paging.

145 Description of significant parameters which can be included in the URL template within
146 an OSD document:

147

148 **/opensearch:count**

- 149 The desired number of results to return per page
150 **/opensearch:startIndex***
151 The starting index number of the returned results
152 **/opensearch:startPage***
153 The starting page number of the returned results

154 * A Search service *SHOULD NOT* use both *startIndex* and *startPage*, since their
155 functions overlap.

156 Example:

157

```
http://example.com/test?q={searchTerms}
```

158

```
&startIndex={startIndex?}&format=atom
```

159 Description of significant elements that a Search service **SHOULD** return in the response:

- 160 **/opensearch:totalResults**
161 The total number of results available for the query
162 **/opensearch:startIndex**
163 The start index of this result set
164 **/opensearch:itemsPerPage**
165 The maximum number of items to be returned in a result response

166

```
<atom:feed>
```

167

```
...
```

168

```
<opensearch:totalResults>492420</opensearch:totalResults>
```

169

```
<opensearch:startIndex>1</opensearch:startIndex>
```

170

```
<opensearch:itemsPerPage>10</opensearch:itemsPerPage>
```

171

```
...
```

172

```
</atom:feed>
```

173

174

175 The response **MAY** include paging links to the previous and next results. In addition, the
176 service **MAY** include the first results page, current results page, and last results page. For
177 instance, if the response format is Atom, the paging links can be included as follows:

178

179

```
<atom:feed>
```

180

```
...
```

181

```
<atom:link rel="previous" href="http://example.com/test?q=tanks&page=2&format=atom"
```

182

```
type="application/atom+xml"/>
```

183

```
<atom:link rel="next" href="http://example.com/test?q=tanks&page=4&format=atom"
```

184

```
type="application/atom+xml"/>
```

185

```
<atom:link rel="self" href="http://example.com/test?q=tanks&page=3&format=atom"
```

186

```
type="application/atom+xml"/>
```

187

```
<atom:link rel="first" href="http://example.com/test?q=tanks&page=1&format=atom"
```

188

```
type="application/atom+xml"/>
```

189

```
<atom:link rel="last" href="http://example.com/test?q=tanks&page=447&format=atom"
```

190

```
type="application/atom+xml"/>
```

191

```
...
```

192

```
</atom:feed>
```

193

194

195 The paging mechanism supported by the Search service does not guarantee continuity of
196 search results while switching pages. Content resources may be added, updated, or

197 removed in the period of time between which the different pages of the result set are
198 accessed -- without the consumer being aware of these changes. Therefore, service
199 consumers SHOULD NOT present paged result sets as coherent or complete or make
200 assumptions to that effect.

201 **2.4 Result Presentation**

202 The CDR Specification Framework identifies additional result presentation behaviors:

203

- 204 • Result Sorting Order
- 205 • Result Metadata Style

206

207 Support for sorting functionality is OPTIONAL, however Search services SHOULD
208 provide results sorted by relevance by default, if possible. The base search request does
209 not include any parameters to request or control sorting (i.e., the Result Sorting Order
210 variable described by the CDR Specification framework is ignored). Instead, individual
211 Query Type specifications MAY add sorting parameters and behavior requirements.

212

213 There will be a different endpoint for each supported response type (e.g., HTML, Atom
214 feed).

215 **2.5 Relevance of Search Results**

216 The OpenSearch Relevance Extension [OS-RELV] provides a mechanism for
217 communicating the relative importance of each result. Result relevance is generally a
218 measure of how well a specific result matched the original query. Providing a result
219 relevance measure allows better matched results to be prioritized relative to other results.
220 A Search service implementation MAY provide relevance scores for individual search
221 results with respect to the particular search with which it is identified. The OpenSearch
222 Relevance extension defines a single element:

223 **/relevance:score**

224 The range of values allowed is any decimal between 0 to 1, inclusive, with 1
225 being the most relevant and 0 the least.

226

227 Usage:

228

229 `<relevance:score>0.97</relevance:score>`

230

231 This scheme does not define the mechanism by which the relevance score is determined.
232 In addition, comparing scores calculated under this scheme by different Search service
233 instances may not provide a true comparison of relevancy.

234

235 An example Atom feed that includes opensearch:Relevance elements in its individual
236 results follows:

237

```
238 <atom:feed>
239 ...
240 <atom:entry>
241   result metadata
242   ...
243   <relevance:score>0.97</relevance:score>
244 </atom:entry>
245 <atom:entry>
246   result metadata
247   ...
248   <relevance:score >0.42</ relevance:score>
249 </atom:entry>
250 ...
251 </atom:feed>
252
```

253 3 Search Service Interface

254 3.1 Input

255 The URL template within the OSD document defines the syntax for how to call the
256 Search service. The URL element requires two attributes to be present:

257 /**@type**

258 Contains the MIME type of the query result format

259 /**@template**

260 Contains the query URL to be processed according to the syntax rules

261 The template syntax rules define how values can be placed into the URL to create a valid
262 query. For example:

```
263 <Url type="application/atom+xml"  
264 template="http://example.com/?q={searchTerms}&pw={startPage?}&format=atom"/>
```

265 The type parameter determines the return format of the query. Guidance on return
266 formats is discussed in Section 4.3.

267 Both {searchTerms} and {startPage?} are variables that are to be replaced by a user or
268 application using the URL. Variables without a question mark are required to be
269 replaced with an actual value. Variables with question marks are required to be replaced
270 by an empty string or by an actual value. An empty string indicates that the parameter
271 should not be used for the query.

272 For further guidance regarding the URL element and the URL template syntax, refer to
273 the OpenSearch specification.

274 3.1.1 Relation to Inputs Defined in the Specification Framework

275 The IC/DoD CDR Specification Framework defines a number of required (R) and
276 optional (O) inputs to the Search operation. The following table relates the disposition of
277 each variable defined in the Framework in this specification:
278

279 **Table 2 – Framework Input Variable Disposition**

<i>Activity</i>	<i>Framework Input Variable</i>	<i>Search Specification</i>
Search	Query (R)	The query is an aggregate of the parameters in the request (R).
	Query type (O)	Implicit – query type is implicit in the Open Search parameter.

	Query metadata (O)	Specialized – query type definitions MUST specify all possible information (including metadata) that can be used as input for its type. In essence, query metadata is moved from the common search request and down into the specific query types, to be defined and used as necessary on a per-type basis.
	Timeout (O)	<i>Not supported</i>
Results paging	Results per page (O)	opensearch:resultsPerPage (O)
	Start index (O)	opensearch:startIndex (O)
	Query identifier (O)	<i>Not supported</i>
Results presentation	Result metadata format (O)	Implicit – each Search service binding MUST be associated with a specific result metadata format. Therefore this input variable is not needed.
	Result sorting order (O)	Default sorting by relevancy is RECOMMENDED . Individual query types MAY define input variables to control custom sorting; otherwise sorting order input is not supported and no variable is defined.

280

281 The CDR Specification Framework allows for *Query Metadata* as an optional Search
 282 input. This Search Service Specification does not enable input of metadata independent
 283 of a particular type of query. Individual query types **MAY** define metadata inputs and
 284 other kinds of inputs, as desired, as part of their search syntax. In the RESTful
 285 implementation specified by this document, this information is implicit in the type of
 286 parameter(s) sent in the Search Service request, therefore a query type input is not
 287 necessary.

288 **3.1.2 OpenSearch Paging Parameters**

289 The Search service specification is **REQUIRED** to function as described by the
 290 Specification Framework with any input, behavior, output, and fault condition extensions
 291 listed below.

292

293 ***/startIndex***

294 This **OPTIONAL** element indicates the offset of the first result in a result set. Its
 295 value, if provided, **MUST** be an integer. The base value **SHOULD** be 1.

296 ***/resultsPerPage***

297 This **OPTIONAL** element describes the desired number of search results per page.
 298 Its value, if provided, **MUST** be greater than or equal to 1. The default value is
 299 10. Support for this property is **REQUIRED**.

300 **3.1.3 OpenSearch Query Type Extensions**

301 The OpenSearch specification defines one parameter, searchTerms, for the query.
 302 OpenSearch does not specify a syntax for the contents of the searchTerms parameter.
 303 Extensions to OpenSearch have been developed to support query types that go beyond
 304 keyword-style queries. These include:

305

306

- **OpenSearch Geo Extension [OS-GEO]** – Defines parameters for supporting bounding box, point-radius, polygon, and other geospatial query types.

307

308

309

- **OpenSearch Time Extension [OS-TIME]** – Defines parameters for specifying a time range. This specification does not describe how to interpret the temporal query terms. For example, it does not specify that the temporal terms apply to the date a resource was created or posted, or that it may apply to a historical event described by the resource. Guidance related to interpretation can be found in implementation guidance, such as the DoD Discovery Metadata Specification Implementation Guide [DDMS].

310

311

312

313

314

315

316

3.2 Behavior

317

An implementation of the Search service **MUST** follow the behavior defined in the CDR Specification Framework. Additional requirements on behavior **MAY** be defined by query type specifications. Search services **MUST** implement the behaviors required by the query types they support.

318

319

320

321

3.3 Output

322

In addition to the requirements imposed by the CDR Specification Framework, the Search service Search function output is additionally constrained by the requirements specified in the OpenSearch Specification.

323

324

325

326

The following example illustrates the high level components of a response message (containing a result set of unspecified type) from a Search service:

327

328

329

330

331

332

333

334

335

```
<result-set>
...
<result>...</result>
<result>...</result>
...
</result-set>
```

336

3.3.1 Relation to Outputs Defined in the Specification Framework

337

The IC/DoD CDR Specification Framework [CDR-SF] defines a number of required (R) and optional (O) outputs from the Search operation. The following table relates the disposition of each variable defined in the Framework in this specification:

338

339

340

341

Table 3 – Framework Output Variable Disposition

<i>Activity</i>	<i>Framework Output Variable</i>	<i>Search Specification</i>
Search and Results Paging	Result set (R)	A <i>Search</i> service MUST return a formatted set of results. Search service implementations SHOULD support HTML and Atom response formats.
	Results metadata (R)	CDR Result Type specifications MAY require certain types of data to be returned as part of the result set or individual result entries. Those specifications MAY also allow other types of metadata to be included and describe the mechanism for doing so. A Search service that supports a particular result type MUST follow the syntax and processing rules defined by that type. (R)
	Result set retrieval properties (O)	Not Supported.
	Result relevancy value (O)	relevance:score in each result
	Result retrieval properties (O)	An element describing the linkage to the <i>Retrieve</i> service MUST be included in the results. (O)
	Timestamp (O)	CDR Result Type may require timestamp element (ie feed/updated).
	Query identifier (O)	Not Supported.
	Response result count (O)	opensearch:itemsPerPage SHOULD be included in the response.
	Total result count (O)	opensearch:totalResults SHOULD be included in the response.

342

3.3.2 Including the Search Request in the Response

To facilitate paging capabilities and to provide service consumers the ability to re-execute their queries, the search request that produced the output MAY be included in the results response. The mechanism for doing this will depend on the response format being returned. In the following example, the Search Request is inserted directly under the root of a notional response:

349

```

350 <atom:feed>
351   ...
352   <atom:link rel="self" href="http://example.com/test?q=tanks&page=1&format=atom"
353   type="application/atom+xml"/>
354   ...
355 </atom:feed>

```

356

3.3.3 Including Metadata in the Results

Depending on the underlying data resources and the type of search request being executed, Search services MAY return metadata about each resource beyond that required by the Result Type specification. That specification controls the mechanism and

361 syntax for including any additional metadata and whether or not such inclusion is
362 permitted. Search services that support a particular Result Type in its response **MUST**
363 follow the requirements in the associated Result Type specification.
364

365 **3.3.4 OpenSearch Paging Elements**

366 Search service implementations SHOULD use the elements and parameters from the
 367 OpenSearch specification for paging purposes. The exact mechanism and syntax for
 368 including the OpenSearch extensions are defined by the specification for the Result Type
 369 being used. The requirements for the inclusion of OpenSearch extensions are listed in the
 370 table below.
 371

372 **Table 4 – OpenSearch Output Extensions**

Element	Description
<p>opensearch:totalResults</p>	<p>The actual or estimated number of resources that match the current query.</p> <p>In the absence of a totalResults element or a next link (<code>//link[@rel='next']</code>), the search client should consider the current page to be the last page of search results.</p> <ul style="list-style-type: none"> • Restrictions: The value must be a non-negative integer. • Default: The default value is equal to the offset index of the last search result on the current page. • Requirements: The element may appear zero or one time. <p>Recommendation: The Search Service implementation SHOULD include the opensearch:totalResults in the response.</p> <p>Example:</p> <pre data-bbox="667 1331 1395 1425" style="border: 1px solid black; padding: 5px;"> <opensearch:totalResults> 492420 </opensearch:totalResults></pre>
<p>opensearch:startIndex</p>	<p>The offset of the first search result in the current set of search results.</p> <p>The OpenSearch specification allows for any integer offset for the first search result (0, 1, -5, etc.) The index of the first search result MAY be indicated in the OSD document's "Uri" element, using the indexOffset attribute.</p> <p>If the startIndex element does not appear on the page then the search client should consider the current page to be the first page of search results.</p> <ul style="list-style-type: none"> • Restrictions: The value MUST be an integer.

	<ul style="list-style-type: none"> • Requirements: The element MAY appear zero or one time. <p>Recommendation: The Search Service implementation SHOULD include the <code>opensearch:startIndex</code> in the response. A Search implementation SHOULD use an <code>indexOffset</code> of 1.</p> <p>Example:</p> <pre data-bbox="669 543 1398 640" style="border: 1px solid black; padding: 5px;"> <opensearch:startIndex> 11 </opensearch:startIndex></pre>
<p><code>opensearch:itemsPerPage</code></p>	<p>The number of search results returned per page.</p> <p>If the <code>itemsPerPage</code> element does not appear on the page then the search client SHOULD use the number of items of the current page as the default page size.</p> <ul style="list-style-type: none"> • Restrictions: The value must a non-negative integer. • Default: The default value is equal to the number of search results on the current page. • Requirements: The element may appear zero or one time. <p>Recommendation: The Search Service implementation SHOULD include the <code>opensearch:itemsPerPage</code> in the response.</p> <p>Example:</p> <pre data-bbox="669 1251 1398 1348" style="border: 1px solid black; padding: 5px;"> <opensearch:itemsPerPage> 10 </opensearch:itemsPerPage></pre>

373

374 The following XML illustrates one possible representation of these properties in a
375 notional response (the Result Type specification will define the exact representation):

376
377
378
379
380
381
382
383

```
<atom:feed>
...
<opensearch:totalResults>12</opensearch:totalResults>
<opensearch:startIndex>11</opensearch:startIndex>
<opensearch:itemsPerPage>10</opensearch:itemsPerPage>
...
</atom:feed>
```

384 **3.4 Fault Conditions**

385 An implementation of the Search service **MUST** allow for the Fault Conditions defined in
386 the CDR Specification Framework.

387

388 Query type specifications **MAY** create additional Fault Conditions, as necessary. Any
389 new fault types **SHOULD** derive from existing fault types, if possible.

390

391 Table 5 maps the CDR Specification Framework fault conditions to the HTTP status that
392 **SHOULD** be returned for each.

393

394

Table 5 – Fault Conditions and HTTP Responses

CDR Framework Fault Condition	HTTP Status	HTTP Description
Unauthorized Access	403	Forbidden
Unsupported Query Type	400	Bad Request
Unsupported Search Request Syntax	400	Bad Request
Unsupported Search Element	400	Bad Request
Invalid Paging Value	400	Bad Request
Paging Value Out of Range	404	Not Found
Service Execution Error	500	Internal Service Error

395

396 **4 Search Service Implementation**

397 This section provides additional implementation guidance beyond the behavior and
398 interface guidance provided in the previous sections.

399 **4.1 Policy**

400 This specification defines the technical requirements and guidelines for implementing a
401 Search service. Policy for Search service implementations is described in auxiliary
402 documents. See the Reference Documents section for a listing of relevant policy
403 documents. Implementers **MUST** follow the guidance in those policy documents.

404 **4.2 Query Types**

405 The CDR Specification set includes a number of Query Type definitions that IC/DoD
406 organizations can leverage in their Search service implementations, depending on the
407 applicable policies and implementation profiles.

408 4.3 Result Types

409 The CDR Specification set includes a single predefined Result Type definition that
 410 IC/DoD organizations can leverage in their Search service implementations, the IC/DoD
 411 Content Discovery and Retrieval Atom 1.0 Result Set Specification [CDR-ATOM].
 412 Implementers SHOULD consult appropriate policy and implementation guidance to
 413 determine requirements or recommendations concerning the use of particular Result
 414 Types.

415 4.4 Sorting of Search Results

416 Sorting is OPTIONAL for Search services. Search services that do implement sorting
 417 SHOULD return results sorted by relevance.

418 4.5 Security Considerations

419 Any resource *may* have associated policies for use, especially as applies to authentication
 420 and authorization. These policies *may* be asserted by both the resource owner and those
 421 responsible for governance and management of the enterprise. The implementation of
 422 policies related to security considerations SHOULD leverage the specific security
 423 components and interactions defined by the Joint IC/DoD Security Reference
 424 Architecture (SRA), and MUST be in compliance with requirements and guidance for
 425 security outcomes as specified in the SRA and its associated specifications.

426 5 Reference Documents

427 The documents in this section provide the foundation for the Search service. Each
 428 document is assigned a reference identifier, which is cited when the document is
 429 referenced within this Search Service Specification.
